

RGB color space

Each screen pixel is driven by three small and very close but still separated light sources.

At common viewing distance, the separate sources are indistinguishable, we interpret them as a solid color.

additive (light)

subtractive (pigment, ink)

CRT monitor

HSL and HSV

Rearrange the geometry of RGB in an attempt to be more intuitive and perceptually relevant than the cartesian (cube) representation.

Used today in color pickers and image editing software
