

Perception & cognition

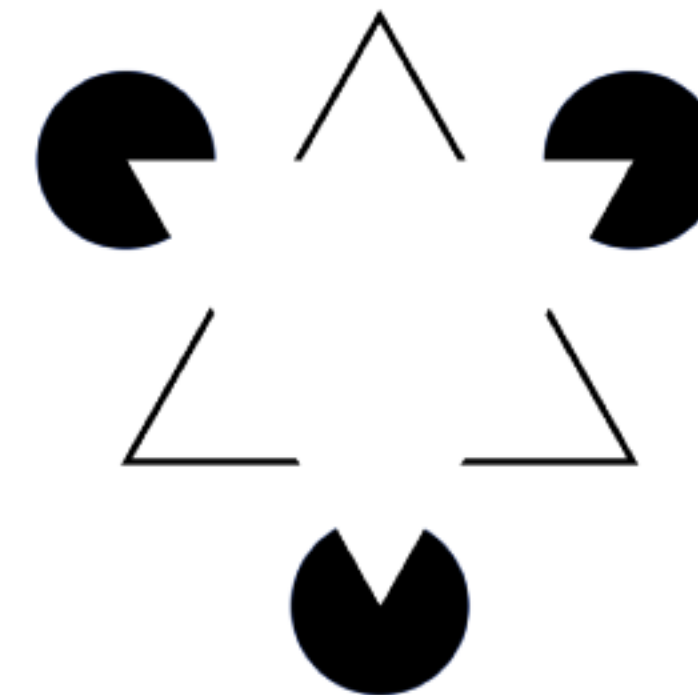

How do people process visual information? How do they reason about the data visualized?

Gradient illusion: We perceive an intensity gradient for the bar, although it has the same shade throughout.

Zöllner illusion: The diagonal stripes are not parallel, are they?

Kanizsa's triangle evokes the perception of a contour that is not actually present in the image. Gestalt-psychologists refer to reification in this context.

The Penrose triangle is perceived as an object with 3D attributes, however, a conscious effort reveals that this triangle can not exist (without extracted edges).

Color theory

How do colors influence perception and guide attention in visualizations?

What role does color play in differentiating data and conveying meaning?

How can we choose color palettes that ensure clarity and accessibility?
