

Guideline - many categories

Instead of giving each item a categorical color, encode them with **a secondary dimension** – ideally, one with few values.

An exception is when the chart is paired with other charts that use color for the same categories.

Guideline - sequential

Don't use categorical or diverging colors with sequential data

Categorical colors are optimized for maximum differentiation.

Using them for sequences (ordinal, interval, or ratio scales), even when arranged by hue, makes it more difficult for users to understand.
